# Statement of Delivery

## I. Changes

## 1. Global Navigation

jQuery is used in the global navigation and there is no background colour and border. There are animations that can attract the users and it is also a easy way to show the second-level menu.

## 2. Remove the Navigation Line

In the design document, there is a line that shows where you are in every page except the home page. However, if there is a global navigation with an effective design, users would never use the navigation line. And this website is not a website with a complicated structure, so the navigation line is redundant.

## 3. Fonts

Given that there could be some computers that the fonts "Source Sans Pro" and "Copperplate Gothic Bold", the fonts will be automatically converted to "Times New Roman", which is a more common font.

## 4. Margin of the Main Content

There are 9% margins in the left and right of the main content part and the left and the right sides of the main content are not aligned to the navigation bar, which is different from the design document.

## 5. Footer

There is a word-form navigation in the footer, which is especially for those whose browses do not support JavaScript.

## 6. Feedback and Share

In the design document, the accesses to the page are in the introduction of every kind of tours. However, it is hard to create an access in an introduction page because it is likely to destroy the original design. And it is easy to put in "Booking" pages.

## 7. Font Size

The font sizes in the design document is not suitable in the development of the website.

So the new sizes are: the logo is 40pt, the global navigation is 16px, the first and the second level local navigation in "Booking and Discussion" pages are 20px and 16px respectively, the accesses to tour details and feedback page are 20px, the "Rate" and "Overall Rate" are 20px, the main texts are 14px in default, and the texts in the footer are 10px.

## 8.Social Media Icons

The icons were changed. They are collected from [www.iconarchive.com](www.iconarchive.com).

## 9. The "Schedule" in "Tours" pages

The "Schedule" in "Tours" pages are delete and a link to a page that contains the everyday plan replaces it in every page, because it seems no certain aim and it is better to use a more simple way to present the information the customers want to know.

## 10. Border

In the home page, the main table has a 2px border and every item has a 1px border. And every image has 2px border. The main contents in all pages except the "Honeymoon Special" pages also have 2px borders.

**II. JavaScript**

# 1. Pop-down Menu in Global Navigation

When the mouse stops at the global navigation, a block will appear with animation. And if there is a second-level menu, it will also be shown at the same time.

It is needed because in my original design, there are pop-down menus. And the animation may attract the users' attention and it could be helpful to leave a good impression.

# 2. Highlighting the Social Media Icons

When the mouse stops at the social media icons, they will be "highlighted", and when the mouse leaves the icon, it becomes the original status. Actually this script just changes the CSS style that includes the opacity of the icons.

It just an attraction to users and it makes the website more interactive.

# 3. Rating

When the mouse stops at the star, it will show how many stars you rate. For example, if you want to give 4 stars to the meal, you can just move your mouse to the 4th star and click. When the mouse is moved to the 4th star, the first 4 stars' colour will become orange rather than gray. And if you click it, it will pop-up a messagebox that tells you your rating.

It is necessary for the rating process, and it also make the rating more clear and it is more interesting than rating by digits, which can make the website funnier.
